

In order to help you understand the care we have provided; I have prepared this examination report to address the principal features of your eye health and your vision correction requirements.

PRESBYOPIA (prez-bee-O-pee-ah)

Your eyes require special lens correction in order to achieve clear and comfortable close-range vision. Presbyopia is a normal decline in close-range focusing ability of our eyes with time.

Presbyopia seems to come suddenly but actually it does not. Our eyes have maximum focusing ability in our early teens; however, by the time we reach our seventies, our eyes have lost all of their variable focusing ability. A person with good distance vision will typically notice the beginning of close-range difficulty in his or her late thirties or early forties. All healthy eyes will change naturally and predictably with the passage of time. The cause of presbyopia is not a weakening of the eye muscles but rather a loss of elasticity of the focusing lens inside the eye.

Wearing proper prescription will not weaken or change your future visual status in any way. The effects of presbyopia constantly change. As a result, periodic updates in your prescription are necessary to maintain correct visual function at all ranges of vision. Eyeglasses, biofocals, trifocals, and contact lenses are all available to remedy this common, unavoidable visual condition.

I hope you have found this report interesting and informative. This personalized report has been motivated by my goal to provide excellence in eye care. I look forward to seeing you for your future eye needs.
